

Announcing A Breakthrough In Cataract Implant Surgery

If you are thinking about having cataract surgery, then this exciting new multifocal lens implant technology may be for you.

For people with cataracts, life without glasses or bifocals is something they either experienced when they were young or they just dreamed about most of their life. Today, thanks to a revolutionary new multi-focal intraocular lens (IOL) implant called the Acrysof® ReSTOR® IOL, our leading eye surgeons, Dr. Alan Berg and Dr. Robert Feinfield can turn those dreams of reducing your dependency upon glasses into reality by providing a full range of vision, from near to far, after cataract surgery. In fact, clinical trials have demonstrated that 4 out of 5 patients never needed to wear glasses or bifocals following bilateral cataract surgery. If you are experiencing changes in your vision due to cataracts and would like to be able to read small print, work on a computer, drive a car or play golf or tennis free of dependence on glasses, call our office to see if you are a candidate for this vision restoring procedure.
